CSAR Service - Management Report

June 2000

This report documents the quality of the CSAR service during the month of June 2000.

A more comprehensive report is provided quarterly, which additionally covers wider aspects of the Service such as information on Training, Application Support and Value-Added services.

This and other such reports are made available through the Web to staff within EPSRC and the other Research Councils, to CfS staff and CSAR Service users. The reports are indexed in a similar way to that which other useful information and news are listed for selection.

1. Introduction

June has seen the T3E workload running at consistently above baseline, 47.5% over at the end of the month.

The workload has continued to be of jobs predominantly larger than 33 PEs.

This document gives information on Service Quality and on actual usage of the CSAR Service during the reporting period of June 2000. The information, in particular, covers the availability and usage of the following two main CSAR Service High Performance Computing (HPC) systems:

- ➤ Cray T3E-1200E/776 (Turing)
- SGI Origin2000/16 (Fermat).

The information is provided in both textual and graphical form, so that it is easier to see trends and variances.

2. Service Quality

This section covers overall Customer Performance Assessment Ratings (CPARS), HPC System availability and usage, Service Quality Tokens and other information concerning issues, progress and plans for the CSAR Service.

2.1 CPARS

<u>Table 1</u> gives the measure by which the quality of the CSAR Service is judged. It identifies the metrics and performance targets, with colour coding so that different levels of achievement against targets can be readily identified. Unsatisfactory actual performance will trigger corrective action.

CSAR Service - Service Quality Report - Performance Targets

			Performar	ce Targets		
Service Quality Measure	White	Blue	Green	Yellow	Orange	Red
HPC Services Availability						
Availability in Core Time (% of time)	> 99.9%	> 99.5%	> 99.2%	> 98.5%	> 95%	95% or less
Availability out of Core Time (% of time)	> 99.8%	> 99.5%	> 99.2%	> 98.5%	> 95%	95% or less
Number of Failures in month	0	1	2 to 3	4	5	> 5
Mean Time between failures in 52 week rolling period (hours)	>750	>500	>300	>200	>150	otherwise
Fujitsu Service Availability						
Availability in Core Time (% of time)	> 99.9%	> 99.5%	> 99.2%	> 98.5%	> 95%	95% or less
Availability out of Core Time (% of time)	> 99.8%	> 99.5%	> 99.2%	> 98.5%	> 95%	95% or less
Help Desk						
Non In-depth Queries - Max Time to resolve 50% of all queries (working days)	< 1/4	< 1/2	< 1	< 2	< 4	4 or more
Non In-depth Queries - Max Time to resolve 95% of all queries (working days)	< 1/2	< 1	< 2	< 3	< 5	5 or more
Administrative Queries - Max Time to resolve 95% of all queries (working days)	< 1/2	< 1	< 2	< 3	< 5	5 or more
Help Desk Telephone - % of calls answered within 2 minutes	>98%	> 95%	> 90%	> 85%	> 80%	80% or less
Others						
Normal Media Exchange Requests - average response time (working days)	< 1/2	< 1	< 2	< 3	< 5	5 or more
New User Registration Time (working days)	< 1/2	< 1	< 2	< 3	< 4	otherwise
Management Report Delivery Times (working days)	< 1	< 5	< 10	< 12	< 15	otherwise
System Maintenance - no. of scheduled sessions taken per system in the month	0	1	2	3	4	otherwise

Table 1

<u>Table 2</u> gives actual performance information for the period of June 1^{st} to 30^{th} inclusive.

Overall, the CPARS Performance Achievement was satisfactory (see Table 3); i.e. Green measured against the CPARS performance targets.

The Fujitsu availability figures are included in Table 2 but not Table 3 as they have zero weighting in CPARS terms.

CSAR Service - Service Quality Report - Actual Performance Achievement

											7	ahla 🤈

Notes:

1. HPC Services Availability has been calculated using the following formulae, based on the relative NPB performance of Turing and Fermat at installation:

[Turing availability x 122 / (122 + 3.5)] + [Fermat availability x 3.5 / (122 + 3.5)]

2 Mean Time between failures for Service Credits is formally calculated based on a rolling 12 month period.

CfS

<u>Table 3</u> gives Service Credit values for the month of June. These will be accounted on a quarterly basis, formally from the Go-Live Date. The values are calculated according to agreed Service Credit Ratings and Weightings.

CSAR Service - Service Quality Report - Service Credits

Table 3

2.2 Service Quality Tokens

The current position at the end of June 2000 is that one of the 461 registered users of the CSAR Service had used Service Quality Tokens.

The graph below shows the total number of registered users on the CSAR Service and the number of users holding a neutral view of the service.

The graph below illustrates the monthly usage trend of quality tokens:

The current status is that one user has submitted 4 Gold Stars to the service.

SUMMARY OF SERVICE QUALITY TOKEN USAGE

No of Stars or	Consortia	Date	Reason Given
Marks		Allocated	
4 Gold Stars	CSN003	14/06/00	Good Applications Support

2.3 Throughput Target against Baseline

The Baseline Target for throughput was fully achieved this month due to plenty of work over the period. The actual usage figure was 147.56% of Baseline capacity.

Throughput Against Baseline CSAR Service Provision

	Baseline Capacity for Period (T3E PE Hours)	Actual Usage in Period (T3E PE Hours)	Actual % Utilisation c/w Baseline during Period
1. Has CfS failed to deliver Baseline MPP Computing Capacity for EPSRC?	355,864	525,104	147.56%
	Baseline Capacity for Period (T3E PE Hours)	Job Time Demands in Period	Job Demand above 110 of Baseline during Perio (Yes/No)?
2. Have Users submitted work demanding > 110% of the Baseline during period?	355,864	518,989	Yes
		Number of Jobs at least 4 days old at end Period	Number of Jobs at least days old at end Period i not zero (Yes/No)?
3. Are there User Jobsoustanding at the end of the period over 4 days old?		8	Yes
4. Have Users submitted work demands above 90% of the Baseline during period?		Minimum Job Time Demands as % of Baseline during Period 119%	Minimum Job Time Demand above 90% of Baseline during Period (Yes/No)? Yes
51	Number of	Average 9/ of time	Average 0/ of time cook
	standard Job Queues (ignoring priorities)	Average % or time each queue contained jobs in the Period	queue contained jobs in the Period is > 97%?
5 Majority of Job Quoyos contained jobs from Usars for more than 97% during period?	4	80.7%	No

Period: 1st to 30th June 2000

3. System Availability

Service availability each reporting period is calculated as a percentage of actual availability time over theoretical maximum time, after accounting for planned breaks in service for preventative maintenance.

3.1 Cray T3E-1200E System (Turing)

The following graphs show the availability of Turing both in core time and out of core time respectively during the period of 1^{st} to 30^{th} June.

Turing availability for June:

Availability of Turing in core time during June was satisfactory, there being only one failure, a power supply, on the morning of the 28^{th} .

Availability of Turing out of core time during June was good with the exception of one system level event on the $28^{th}/29^{th}$ of the month.

3.2 SGI Origin2000 System (Fermat)

The following graphs show the availability of Fermat both in core time and out of core time respectively.

Availability of Fermat in core time during June was excellent.

Availability of Fermat out of core time during June was excellent.

4. HPC Services Usage

Usage information is given in tabular form, in Appendices, and in graphical format. The system usage information for the period of June 1st to 30th is provided by Project/User Group, totalled by Research Council and overall. This covers:

•	CPU usage	Turing:	525,104 PE Hours Fermat:	4,258.25 CPU Hours
---	-----------	---------	--------------------------	--------------------

- User Disk allocation Turing: 42.81 GB Years Fermat: 17.09 GB Years
- HSM/tape usage 768.60 GB Years

In addition, the following graphs are provided to illustrate usage per month, historically:

- a) MPP (T3E) Usage by month, showing usage each month of CPU (T3E PE Elapsed Hours), split by Research Council and giving the equivalent GFLOP-Years as per NPB. The Baseline is shown by an overlaid horizontal line.
- SMP (Origin) Usage by month, showing usage each month in CPU Hours, split by Research Council and giving the equivalent GFLOP-Years as per NPB. The Baseline Capacity is shown by an overlaid horizontal line.
- c) High Performance Disk (T3E) allocated for User Data by month, showing the allocated space each month in GBytes, split by Research Council. The Baseline Capacity (1 Terabyte) is shown by an overlaid horizontal line.
- d) Medium Performance Disk (Origin) allocated for User Data by month, showing the allocated space each month in GBytes, split by Research Council. The Baseline Capacity (1.5 Terabytes) is shown by an overlaid horizontal line.
- e) HSM/Tape Usage (T3E) by month, showing the volumes held each in GBytes, split by Research Council. The Baseline Capacity (16 Terabytes) available will be shown by an overlaid horizontal line.

4.1 Cray T3E-1200E System (Turing)

The following graph shows the usage of Turing during each day of June 2000. Note that there is some variance on a day-to-day basis as the accounts record job times, and thus CPU usage figures, at the time of job completion which could be the second actual day for large jobs. At present, there is a 12 hour limit on jobs, so that they are check-pointed, and computational time lost due to any failure is well managed.

Turing usage for June:

The above usage graph for the Turing system shows that the overall workload was variable, though as can be seen from the graph there were fewer periods with low work volumes.

The above graph also indicates the workload at times reached 100% of maximum theoretical capacity.

Fine tuning of the CfS scheduling system will continue to ensure minimal wasting of PE resource, in order to fit in a number of different sized jobs (e.g. 32, 64, 128, 256) thus facilitating maximised job throughput.

In particular, Turing will continue to start large jobs above 256 PEs, including 512 PEs, every night they are queued subject to the overall workload.

CfS

4.2 SGI Origin2000 System (Fermat)

The usage of the Origin system was low for the month with the daily usage of the system averaging only 37% of theoretical maximum. This figure does not show that in some periods CPU time is running at 99.9% of the total available CPU time. The groups most heavily using the Fermat system are CSE009 (Catlow), CSN001 (Webb) and CSE003 (O'Neill).

The next graph shows the utilisation of the, now fully integrated Fujitsu system.

4.2.1 Fujitsu VPP 300/8 System (Fuji)

Utilisation of the Fujitsu system was variable this month.

4.3 Disk/HSM Usage Charts

The graphs below show current disk and HSM allocations and usage.

The preceding graph shows actual usage on average against the current allocation of disk on the Turing system.

The above graph shows the disk allocations against usage on average of the disk on Fermat.

The above graph shows the total usage of the HSM facility by Research Council.

CSE002 (Gillan), CSE004 (Sandham), CSE024 (Tennyson), CSN001 (Webb) & CSN003 (O'Neill).

Job statistics for Turing:

The above graph shows the number of jobs of the major sizes run in the period 1^{st} to 30^{th} June 2000.

The next graph shows the wait times in minutes for the major categories of jobs.

The chart above shows the average wait time trend over the last 12 months. Despite the major upgrade to Turing (adding 26% to the capacity), wait times are now however growing due to the heavy workload.

It can be seen from the above graph that enhancements to the scheduling on Turing did reduce the average wait times but attention must be paid to ensure sufficient head room exists in the system to prevent wait times from rising. It is intended that the provision of the planned SGI IA-64 systems will assist in better meeting the growth in user demands.

The next graph shows the percentage Turing time utilised by the major job categories for the month.

The average job size in the month of June showed a wide spread, with the bulk of the jobs (61%) being greater than 33 PEs in size.

Turing PE usage is shown by Research Council during the past 12 months of service in the above chart.

Origin 2000 CPU usage is shown by Research Council during the past 12 months of service in the above chart.

4.4 Class 2 & 3 Usage Charts

The next series of charts show the usage of the system by the class 2 & class 3 users. The usage is shown by project and identifies the Research Council of the individual projects.

The above chart shows the most significant PE usage of the Turing system by class 2 and class 3 users.

The chart showing the CPU usage of the Fermat system by class 2 and class 3 users, has not been included due to zero usage.

CfS

The above chart shows the most significant disk allocations on the Turing system for class 2 and class 3 users.

The above chart shows the most significant disk allocations on the Fermat system for class 2 and class 3 users. There is currently no HSM usage by class 2 and class 3 users.

4.5 Charts of Historical Usage

In all the Usage Charts, the baseline varies dependant on the number of days in each month, within a 365-day year.

The graph below shows the PE hour's utilisation on Turing by Research Council for the previous 12 months.

The graph below shows the historic CPU usage on Fermat by Research Council for the previous 12 months.

The next series of graphs illustrates the usage of the disk and HSM resources of the system.

CfS

The preceding graph illustrates the historic allocation of the High Performance Disk on Turing.

The graph above illustrates the historic allocation of the Medium Performance Disk on Fermat.

The graph below shows the historic HSM usage by Research Council funded projects. The primary usage is for NERC.

The next chart shows the historic usage of the Fuji system.

The Fujitsu system was under utilised compared against last months usage figure and the baseline.

4.5 Guest System Usage Charts

There are currently no Guest machines available to the CSAR Service.

5. Service Status, Issues and Plans

5.1 Status

The service has run above baseline since the 200 PE upgrade was carried out in March.

The upgrade of the silo is now in use on the production system.

During the Quarter, 64% of the jobs run on Turing were larger than 33 PEs in size.

5.2 Issues

Wait times are growing with increasing demands for the services.

5.3 Plans

Plans are underway to integrate the ASCI prototype system (Fourier) due to arrive in August.

Hewlett Packard, Compaq and NEC Guest systems are planned to be available from around August. These will be physically based at CSC's Maidstone Data Centre.

6. Conclusion

June 2000 saw the overall CPARS rating at green. The baseline was exceeded by over 47% with the largest proportion of the workload being the larger job sizes.

Continued management attention will be given to maximise the throughput of the Service, whilst balancing as fairly as practicable the shares between Projects and jobs of the varying sizes.

Appendix 1 contains the accounts for June 2000

Appendix 2 contains the Percentage shares by Consortium for June 2000

Appendix 3 contains the Percentage shares by Research Council for June 2000

Appendix 4 contains the Training and support figures to the end of June 2000

Appendix 5 contains a reference table of the consortia name, the subject area and the PI name.

The summary accounts for the month of June 2000 can be found at the URL below
